

Project Assessment-2 Guideline

Previous submissions have covered the requirements and project scope. Stakeholders involved in the project. This submission would cover the architecture and identifying core features for the first deliverable. You are required to prepare following artifacts for this stage of the project submission.

1. Specify finalized project title with a brief description.
2. List major components-UI, Persistence (Data), and Logic.
3. Identify an architecture suitable for your project vision.
4. Identify a minimal set of features that you would like to deliver in next 4 days.
5. Identify users who would benefit from these features.
6. Identify components of this first deliverable.
7. Clearly describe the interface of these components.
8. List the tech stack-Programming language, DB, third party tools/software to be used.
9. Record above information in a **Assesment-2.md** and **commit** it to the **output** folder of the project repository. Only after committing these changes, you should move for implementation below.
10. Implement the first deliverable (keep committing after a method or meaningful changes). Design Unit tests.
11. Update your learnings in **README.md**.
12. Commit all changes. Deadline: **September-28, 2026**.
13. **You are required to commit to the repository at least two different days. (this is part of evaluation criteria).**

Important:

Create and share your github repository Link [GitHub Repo for Project – Fill out form](#)

Deliverable (for your reference):

What is a Deliverable?

A **deliverable** is a tangible outcome that you submit at the end of a project milestone to demonstrate the work completed during that period.

For each weekly submission, you should be able to answer:

What have we produced or accomplished this week that can be reviewed or demonstrated?

A deliverable may include **documents, designs, code, diagrams, configurations, tests, or a working part of the system**. It should provide concrete evidence of your progress rather than simply describing what you intend to do.

For example, in **Deliverable 1**, the expected outcome is a clearly defined project:

- What problem are you solving?
- Who are the users/stakeholders?
- What are the requirements?
- What is included and excluded from the project (implementation)?
- What assumptions and constraints have been identified?

The purpose of the deliverable is therefore **not to produce a lengthy report**, but to establish a clear and agreed-upon foundation for the subsequent stages of development.
